DEFINE PROBLEM STATEMENT

Project: Implement Client Script & UI Policy

Project Name	Implement Client Script & UI Policy
Project ID	SWTID-20206-3268

Problem Statement

The current form experience requires client-side automation and UI-based controls to ensure that fields behave correctly based on user input. Without properly implemented Client Scripts and UI Policies, users may enter incomplete or inconsistent information, see fields that are not relevant to the selected conditions, or miss required information. This can reduce data quality and create unnecessary manual effort during record creation and updates.

Problem to Be Solved

Implement appropriate Client Scripts and UI Policies so that form fields dynamically respond to user actions, required fields are enforced when applicable, and unnecessary fields are hidden or made visible according to defined business conditions.

Expected Outcome

• Improve data accuracy and consistency on the form.

• Provide a clear and user-friendly form experience.

• Automatically control field visibility, mandatory status, and behavior based on conditions.

• Reduce incorrect submissions and avoid unnecessary manual validation.

Scope

The project covers the configuration and testing of Client Scripts and UI Policies for the identified application/form requirements, including condition-based field behavior and validation.

Success Criteria

All defined Client Scripts and UI Policies execute correctly under the specified conditions, the required fields and visibility rules work as intended, and the final form can be submitted without unexpected validation or usability issues.
