PROBLEM-SOLUTION FIT CANVAS

Project Name: Implement Client Script & UI Policy | Team ID: SWTID 2026-3268
Date: 15 March 2026 | Maximum Marks: 5 Marks

1. CUSTOMER SEGMENT(S) [CS]	2. PROBLEMS / PAINS + ITS FREQUENCY [PR]
Primary: ServiceNow users, developers, administrators and trainees who create or maintain forms. **Secondary:** Employees using ServiceNow forms to submit or update records.	Forms may allow incorrect or incomplete data, show irrelevant fields, or fail to guide users based on their selections. These issues can occur frequently during record creation and updating.
3. TRIGGERS TO ACT [TR]	**4. EMOTIONS BEFORE / AFTER [EM]**
• Need to make fields mandatory or optional dynamically. • Need to validate user input immediately. • Need to hide/show or enable/disable fields based on conditions. • Need to improve form accuracy and user experience.	**Before:** Confusion, frustration and uncertainty when forms contain unnecessary or incorrect fields. **After:** Clearer forms, easier data entry, better confidence and fewer input errors.
5. AVAILABLE SOLUTIONS — PROS & CONS [AS]	**6. CUSTOMER LIMITATIONS — e.g. BUDGET, DEVICES [CL]**
Existing options: Manual validation, server-side scripting, basic form configuration and custom development. **Pros:** Can handle complex requirements and provide strong control. **Cons:** May require more development effort, can be slower for immediate form behavior, and may add maintenance complexity.	• Limited ServiceNow development knowledge. • Limited time for configuration and testing. • Users may access forms from different devices and screen sizes. • Need to work within existing ServiceNow platform features and permissions.
7. BEHAVIOR + ITS INTENSITY [BE]	**8. CHANNELS OF BEHAVIOR [CH]**
Users enter, edit and submit records through ServiceNow forms. They frequently select options that should change other fields dynamically. The behavior is high-frequency because form interaction is part of routine record processing.	**ONLINE:** ServiceNow web interface, browser-based forms, ServiceNow application/workspace. **OFFLINE:** User planning, training notes, process discussions and documentation before configuring the form.
9. PROBLEM ROOT / CAUSE [RC]	**10. YOUR SOLUTION [SL]**
The root cause is that static form configurations cannot always respond to changing user input. Without client-side rules and UI policies, fields may remain visible, editable or optional even when the current form condition requires different behavior.	**Implement Client Scripts & UI Policies in ServiceNow.** Client Scripts can validate and respond to user actions on the form, while UI Policies can dynamically control field visibility, mandatory status and read-only behavior. Together they improve data quality, reduce unnecessary input and make forms more user-friendly.

Note: The canvas is completed specifically for the project “Implement Client Script & UI Policy” using the headings and framework provided in the uploaded template.
