CODING & SOLUTION

Project: Implement Client Script & UI Policy (Incident)

Date	15 March 2026	**Team ID**	SWTID-2026-3268
Maximum Marks	5 Marks	**Project Name**	Implement Client Script & UI Policy (Incident)

Solution Summary

Field	Details
Repository Link / URL	Not provided. Add the team's GitHub/GitLab or ServiceNow application repository URL before submission.
Programming Language(s)	JavaScript (ServiceNow Client Script); ServiceNow UI Policy condition and actions.
Framework(s) Used	ServiceNow platform — Incident form and form client-side scripting.
Key Features Implemented	Proposed implementation: (1) On Incident form load, show/hide and require fields according to the selected category. (2) When Priority is Critical (1), make Short Description and Description mandatory and display an on-screen message. (3) Validate required information before submission and prevent submission when mandatory information is missing. (4) Use a UI Policy for declarative field visibility/mandatory behavior and a Client Script for conditional validation/message behavior.
Pending / Incomplete Features	Confirm the exact business rules with the project owner; configure and test in the target ServiceNow instance; add the actual repository URL; attach screenshots or test evidence. These items are not verified from the supplied template.
Setup / Run Instructions	1. Sign in to the ServiceNow development instance. 2. Open System Definition → Client Scripts and create an Incident form Client Script (use onLoad/onSubmit as required). 3. Open System UI → UI Policies and create a policy for the Incident table; define the condition and field actions. 4. Save and test on a non-production instance with normal and Critical priority incidents. 5. Verify field visibility/mandatory states, submit validation, and browser console for errors. 6. Commit/export the configuration and add the repository or update set link.

Code Quality Checklist

S.No.	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	To be verified
2	Meaningful variable and function names are used	To be verified
3	Code includes comments / documentation where necessary	To be verified
4	Error handling is implemented for critical operations	To be verified
5	The application runs without critical errors	To be tested in ServiceNow instance
6	Code is committed to a version control repository	No repository link supplied

Additional Notes / Comments

This completed form uses a reasonable example workflow for an Incident Client Script and UI Policy. The supplied PDF did not contain the team's actual script, UI Policy conditions, repository URL, or test results. Replace the proposed behavior with the exact implementation and verify checklist items before final submission.
