PERFORMANCE TESTING

Date	15 March 2026	Team ID	SWTID-2026-3268
Project Name	Implement Client Script & UI Policy (Incident)	Maximum Marks	5 Marks

Step 1: Testing Overview

Field	Details
Testing Tool Used	JMeter (proposed; use only if actually used)
Type of Testing	Load testing; optional stress testing after baseline
Target Module / API	ServiceNow Incident form — client-side Client Script and UI Policy behavior. No API endpoint specified.
Test Environment	ServiceNow non-production / development instance; exact instance details not supplied
Test Date	To be entered after test execution

Step 2: Test Scenarios

S.No.	Test Scenario / Description	Virtual Users	Duration (sec)	Expected Outcome
1	Baseline: open Incident form and load client-side policy/script	1	60	Form loads; UI Policy and Client Script behaviors work without visible errors.
2	Normal load: multiple users open and edit Incident forms	10	300	Form interaction remains responsive; no unexpected mandatory/visibility behavior.
3	Peak load: concurrent Incident form activity	25	300	No critical failures; response-time targets assessed from actual measurements.
4	Stress: gradually increase concurrent form activity	Increase gradually	300	Identify load point where response time/errors degrade; stop safely if instance is affected.

Step 3: Performance Test Results

No performance test output or screenshots were included in the source file. Actual values are therefore left as Not Measured; do not report these as passed until testing is run.

S.No.	Metric	Target Value	Actual Value	Status	Remarks
1	Response Time (Avg)	< 2 seconds	Not measured	Pending	Record average from test report.
2	Response Time (Max)	< 5 seconds	Not measured	Pending	Record maximum observed response time.
3	Throughput (Req/sec)	Record baseline / target	Not measured	Pending	Report completed requests per second.
4	Error Rate	< 1%	Not measured	Pending	Calculate failed requests as a percentage.
5	CPU Utilization	< 80%	Not measured	Pending	Capture server/instance monitoring data if available.
6	Memory Utilization	< 80%	Not measured	Pending	Capture server/instance monitoring data if available.

Step 4: Observations & Analysis

This project primarily changes Incident form client-side behavior through Client Scripts and UI Policies. Performance impact should be evaluated by comparing form load and interaction timings with the configuration enabled and, where practical, disabled. Review average/maximum response time, error rate, browser console errors, and any available instance resource metrics. No measured observations can be stated until the test is executed.

Step 5: Screenshots / Evidence

Evidence: Not attached in the supplied document. After running tests, insert the JMeter summary/dashboard (or the actual tool report), test date, environment, and relevant browser/ServiceNow screenshots here.

Submission note: Tool choice, scenario user counts, and durations above are a suggested test plan, not claimed test results. Replace with the actual tool and executed values before submission.
