Team ID	SWTID-2026-3268
Project Title	Implement Client Script & UI Policy (Incident)
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

Project Proposal	The proposed solution improves the ServiceNow Incident form by using Client Scripts and UI Policies to provide dynamic form behaviour, improve data validation, and make incident handling more consistent and user-friendly.
Project Overview	Implement Client Script and UI Policy configurations on the Incident table in ServiceNow.
Objective	The primary objective is to automate and control Incident form behaviour by dynamically setting field values, validating user input, controlling field visibility/read-only/mandatory states, and improving the overall incident creation and update process.
Scope	The project covers Incident form configuration using Client Scripts and UI Policies, including form validation, field visibility, mandatory conditions, read-only conditions, and dynamic field behaviour based on incident data.
Problem Statement	Incident forms may contain unnecessary manual steps and inconsistent field usage when fields are not dynamically controlled or validated. This can lead to incomplete or incorrect incident information.
Impact	Applying Client Scripts and UI Policies can improve data quality, reduce manual errors, guide users during incident entry, and provide a more consistent Incident management experience.
Proposed Solution	Configure suitable Client Scripts and UI Policies for the Incident table so that the form responds automatically to user actions and conditions.
Approach	Identify required Incident fields and conditions, create UI Policies for field states such as mandatory/read-only/visible, and use Client Scripts where client-side logic or validation is required. Test the configurations with different Incident scenarios.
Key Features	1. Dynamic Incident field behaviour. 2. Client-side validation and automation. 3. UI Policy control for mandatory, visible and read-only states. 4. Reduced data-entry errors. 5. Consistent Incident form experience.

Resource Requirements

Resource Type	Description	Specification / Allocation
Hardware	Computing Resources	Standard computer/laptop capable of running a modern web browser
	Memory RAM specifications	Minimum 4 GB RAM; 8 GB recommended
	Storage	Sufficient local storage for browser, documentation and project files
Software	Platform	ServiceNow
	Browser	Google Chrome / Microsoft Edge
	Development / Configuration	ServiceNow Studio / Application Navigator; Client Scripts and UI Policies
	Testing	ServiceNow Incident module and test Incident records
Data	Data Source / Type	ServiceNow Incident records and Incident form fields
	Data Format	ServiceNow table records / form fields

Project Configuration Summary	Details
Table	Incident
Configuration 1	Client Script – client-side logic/validation for Incident form behaviour
Configuration 2	UI Policy – controls field visibility, mandatory and read-only states based on conditions
Expected Result	Incident form becomes more dynamic, validated, consistent and easier for users to complete correctly.
