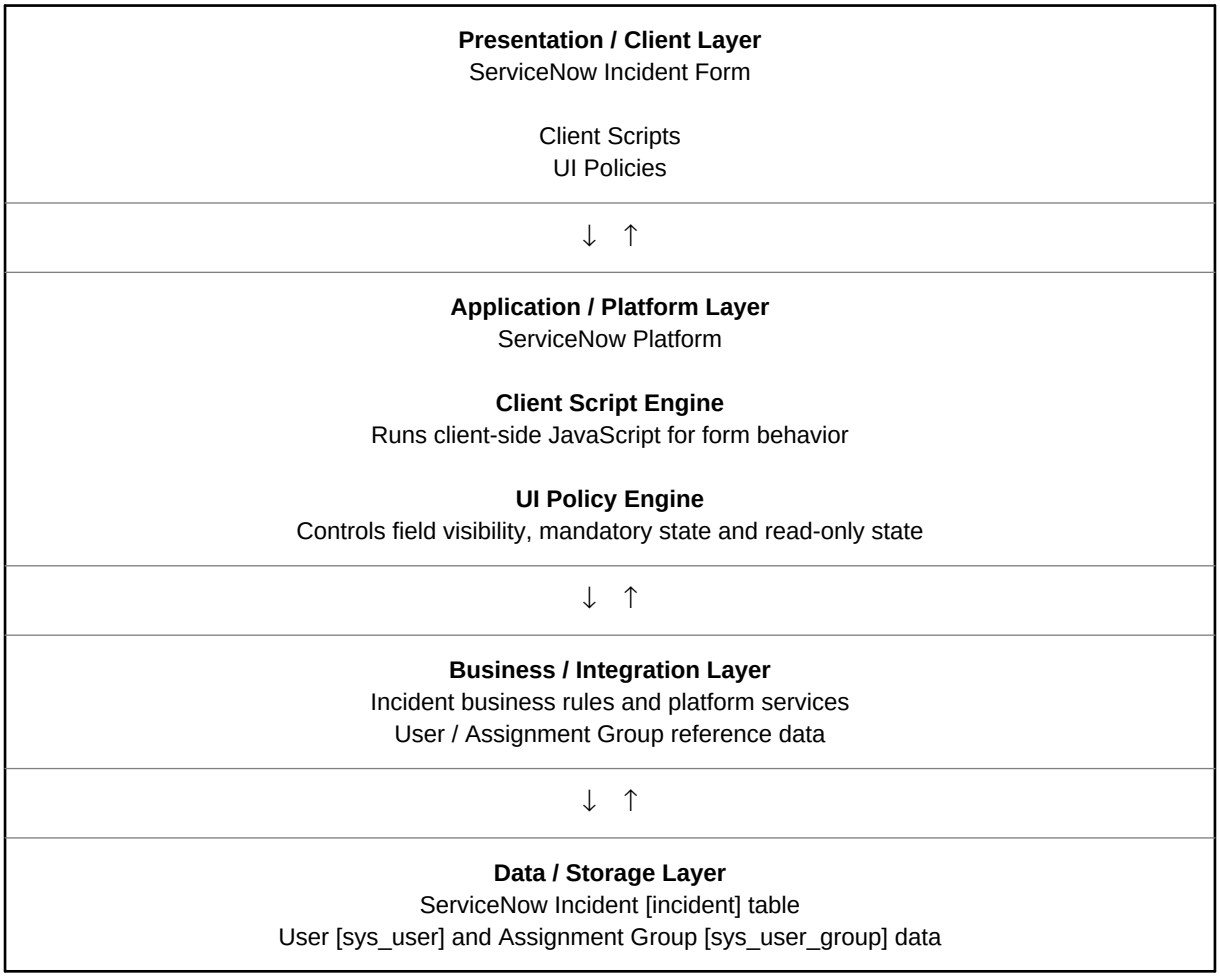
Solution Architecture

Date: 30 September 2026
Team ID: SWTID-2026-3268
Project Name: Implement Client Script & UI Policy (Incident)
Maximum Marks: 5 Marks

Solution Architecture Diagram:

High-level architecture for implementing Client Scripts and UI Policies on the ServiceNow Incident form.



Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	ServiceNow Incident form where users create and update incidents. The form reflects field visibility, mandatory and read-only behavior according to configured UI Policies and Client Scripts.	ServiceNow UI, Incident Form
API Gateway / Platform	ServiceNow platform handles form requests, client-server communication and access to platform services. Client-side actions execute through configured Client Scripts and UI Policies.	ServiceNow Platform, JavaScript
Client Script Engine	Executes client-side JavaScript during form events such as onLoad, onChange and onSubmit to validate or dynamically control Incident form behavior.	ServiceNow Client Scripts, JavaScript
UI Policy Engine	Applies declarative form rules to make fields mandatory, read-only or visible/hidden based on Incident conditions.	ServiceNow UI Policies, UI Policy Actions
Business / Integration	Uses ServiceNow platform services and reference data such as users and assignment groups to support Incident processing and form behavior.	ServiceNow Business Rules, Reference Fields
Database	Stores Incident records and related reference information used by the form and platform logic.	ServiceNow [incident], [sys_user], [sys_user_group]

Project Architecture Summary

The solution uses ServiceNow Client Scripts and UI Policies on the Incident form. UI Policies provide declarative control over field states, while Client Scripts provide dynamic client-side logic. Together they improve Incident form behavior and enforce the required field conditions before data is processed and stored.
