SOLUTION REQUIREMENTS

Project Name: Implement Client Script & UL Policy
Project ID: SWTID-2026-3268

1. Functional Requirements

ID	Requirement	Acceptance Criteria
FR-01	Client script shall initialize and execute according to the defined workflow.	Script loads successfully and performs the expected workflow.
FR-02	Client script shall validate relevant inputs before processing.	Invalid or incomplete inputs are detected and handled appropriately.
FR-03	UL policy rules shall be applied consistently.	Applicable policy rules are evaluated for each relevant request.
FR-04	The solution shall provide clear success, failure, or validation status.	Users/support teams can determine the processing outcome.
FR-05	Relevant events and errors shall be logged for troubleshooting.	Required audit/error information is available to authorized support users.

2. Non-Functional Requirements

Area	Requirement
Security	Protect policy configuration, client data, and logs from unauthorized access or modification.
Performance	Client-side processing should complete within an acceptable response time for normal usage.
Reliability	Failures should be handled gracefully without causing unintended client behavior.
Maintainability	Script and policy logic should be modular, documented, and easy to update.
Compatibility	Solution should work with the supported client/browser/environment versions.
Auditability	Important validation and policy events should be traceable through appropriate logs.

3. Dependencies & Constraints

• Availability of approved UL policy rules and configuration.
• Access to the supported client environment and required integration points.
• Defined test cases and validation criteria.
• Appropriate permissions for deployment, logging, and support.

4. Definition of Done

The client script is implemented, UL policy rules are integrated, functional and non-functional requirements are validated, key test cases pass, relevant documentation is completed, and the solution is ready for the agreed deployment process.
